

# Carrier Connectivity

Harmonize your IT landscape with one standard communication interface. Transporeon offers a single-source connection to your TMS environment that eliminates the complexity of managing multiple information sources by joining all transportation service providers to the same network.

## Industry Challenges:

- » Drain on internal resources from providing **ongoing data maintenance, support and training** to each carrier, requiring specialized staff in a variety of time zones and languages
- » **Lack of visibility into the entire carrier network** reduces the ability to save money and make optimized choices
- » The myth of 100% connectivity to all transportation service providers with resulting **high operational costs and low efficiency gains** to maintain individual EDI connections to an entire carrier base

**Point-to-point integration**  
means complexity for all supply chain partners

## Better carrier collaboration

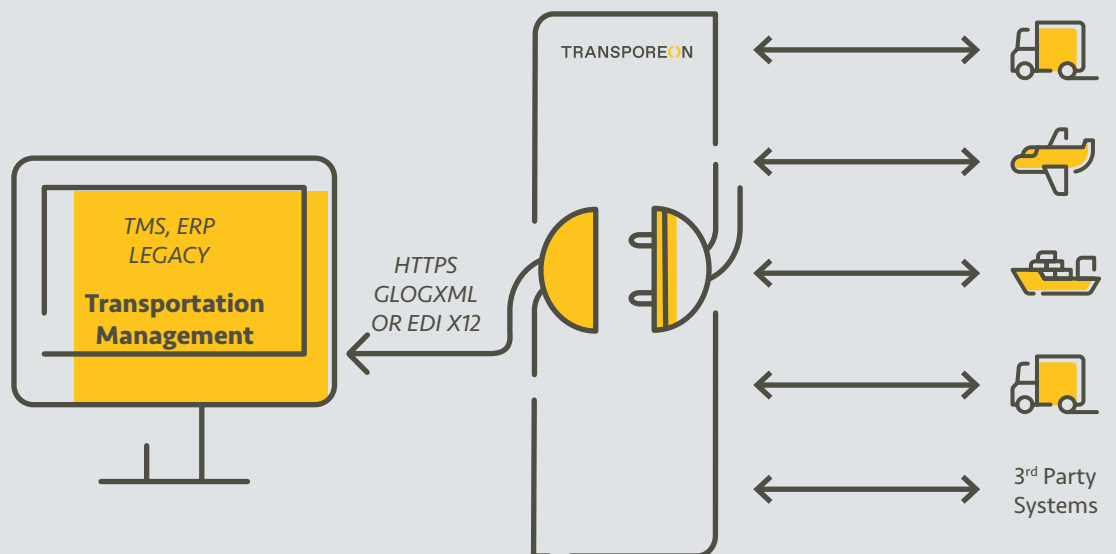

with real-time shipper-carrier connectivity

“55,000+ connected carriers worldwide”

## Benefits

- » **Complete onboarding of every carrier in your network** to improve carrier communication and accelerate initial investments made in legacy TMS or add value to a new TMS project
- » **Increased visibility with real-time access to crucial shipment data** and carrier information means optimized and highly effective decision-making
- » **A fully connected carrier network** with automated “plug & play” connections to each one of your carriers through a web portal, web services, API or EDI integrated directly into your TMS environment
