

ERP Integration

The Enterprise Resource Planning (ERP) interface from Transporeon connects your ERP system to the world's leading logistics network, reducing manual data entry errors and significantly optimising your allocation process. Inefficient transport planning and delays in status reports are also a thing of the past.

Challenges:

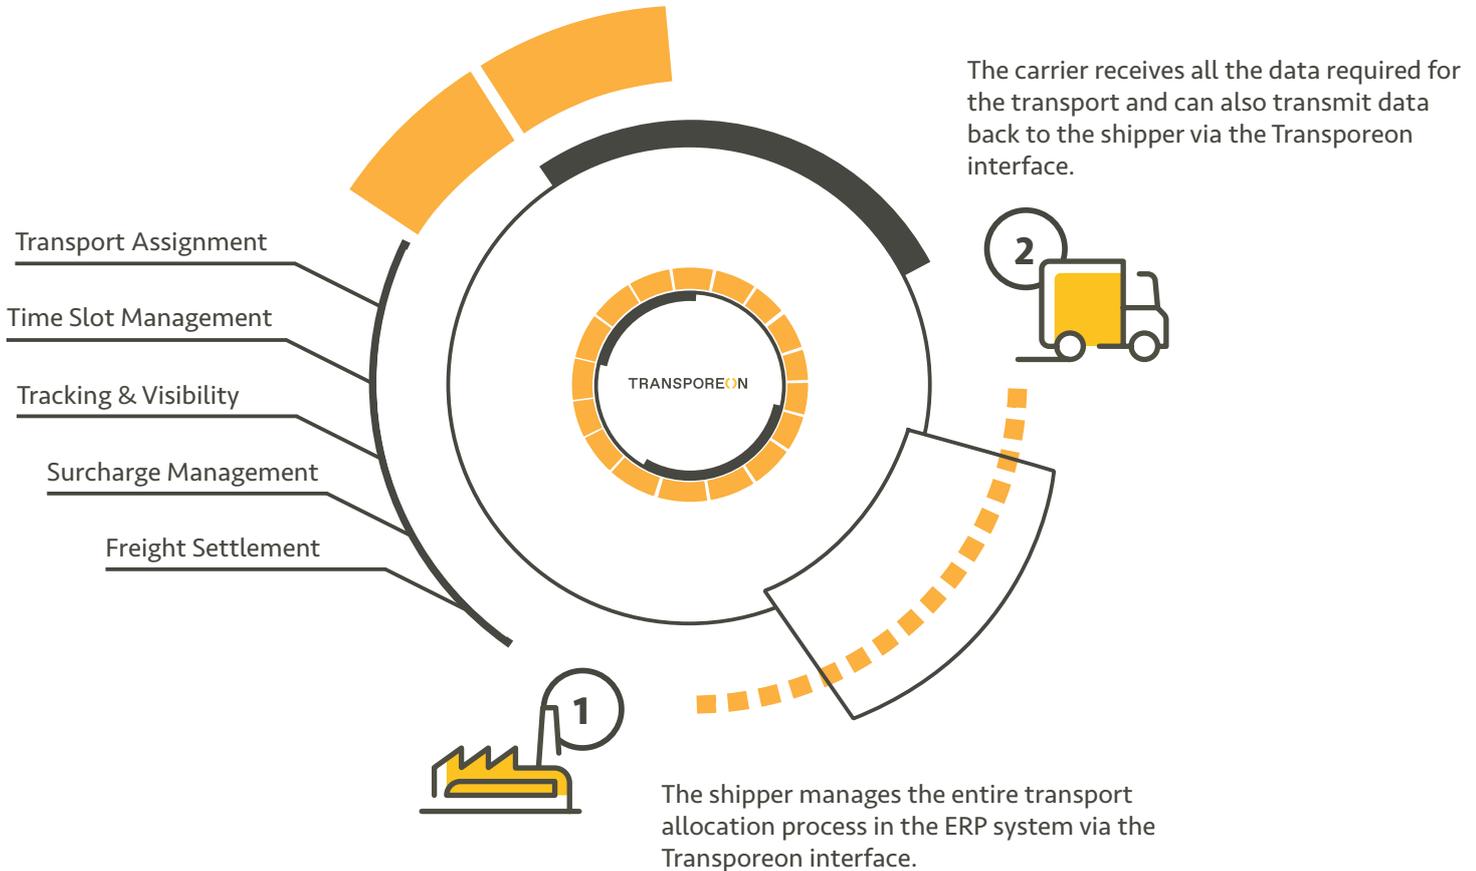

- » **Significant potential for errors and a very time-consuming manual process:**
A high manual coordination effort in the form of telephone, e-mail and fax causes an increased workload and delays for many shippers. As a result, employees make mistakes and transports are often assigned short term – and usually at high cost.
- » **Inefficient transport planning:**
The required know-how for optimal transport and route planning is often unavailable or limited to a few in-house experts. As a consequence, the organization becomes dependent, which can cause problems when employees are on holiday, sick or leaving the company.
- » **Time delay for status messages and different levels of information:**
Status messages entered manually usually don't reach the right people on time, often leading to different levels of information and causing unnecessary delays in the processes.
- » **Manual freight settlement:**
Manual freight settlement often makes it difficult for employees to assign invoices to the correct purchase orders/deliveries in the ERP system. This approach is prone to errors and leads to a high workload.

Features:

- **CENTRAL OVERVIEW**
All data can be viewed by all employees in the ERP system at a glance.
- **REAL-TIME SYNCHRONIZATION**
Automatic synchronization of data between the ERP system and the Transporeon platform.
- **TRANSPORTATION PLANNING**
System-supported and automated transport planning helps to find the right carrier.
- **PROCESS OPTIMISATION AND ERROR REDUCTION**
Reduction of input errors through automatic transmission of (transport) data via the interface.
- **COMMUNICATION CHANNEL**
Direct connection to the world's leading logistics network with over 100,000 collaborating carriers.

How it works:

► **Completes your Enterprise Resource Planning (ERP) system like a missing puzzle piece**

Benefits:

- » Automatic data synchronization ensures that the data is always up to date and status messages are displayed in real time.
- » System-supported transport planning ensures that existing processes are standardised and run independently of employees.
- » Transport costs can be assigned specifically to ERP orders.
- » Central overview of all transport data in the shipper's ERP system.
- » Simple key performance indicators (KPI) tracking and real-time reporting via the ERP system.
- » Increased customer satisfaction thanks to automated and, above all, faster processes.
- » Transporeon is ISO 27001 certified.
